

CFTAs and Plugs

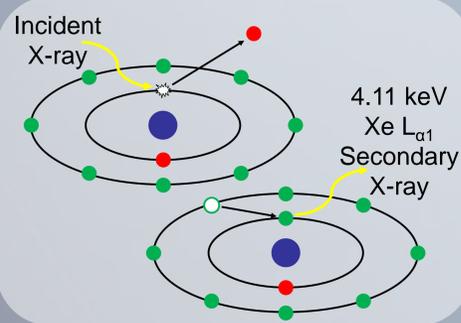

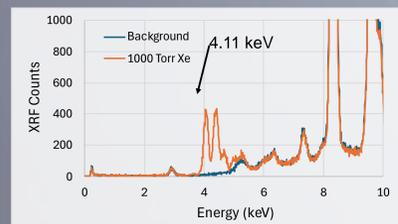

Plugs in Capsule Fill Tube Assemblies (CFTAs) are a manufacturing yield risk for Ignition Targets

Prior to 2021, plugs were only checked after the Target build finished, risking components and assembly labor

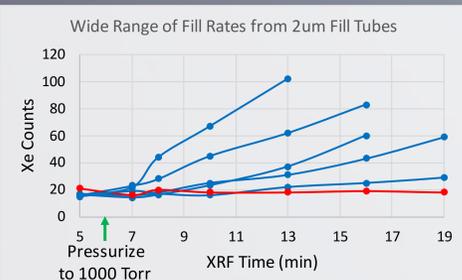

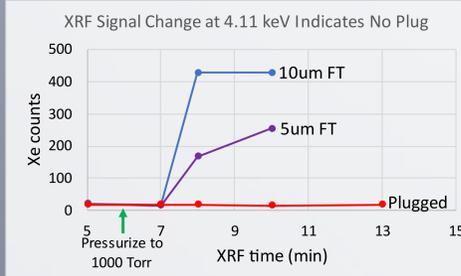

XRF Detection of Xe Indicates No Plug

X-Ray Fluorescence (XRF) provides an understanding of the environment inside the capsule

5µm and 10µm CFTAs immediately show a strong Xe signal

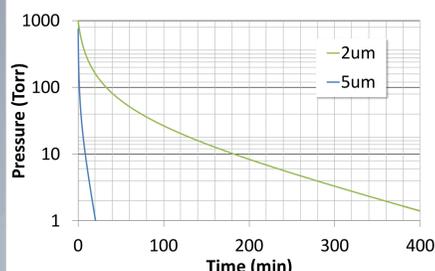

2µm CFTAs fill slowly enough to observe the Fill Rate however the rate varies widely

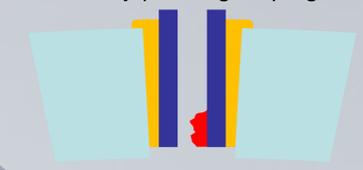

Slope Provides Info on CFTA Fill Rate

The slope of the XRF results is related to the Target Fill Rate at NIF, which is important for NIF shot planning and gas operations. By using XRF data, Fill Rate can be measured 2+ weeks before a Target is completed.

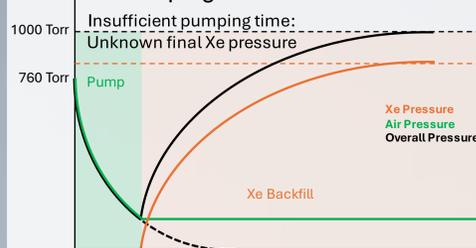

Pump and Fill Rates Vary Based on Fill Tube Diameter

Pump and Fill Rates are further affected by partial glue plugs

Pumping time is Critical

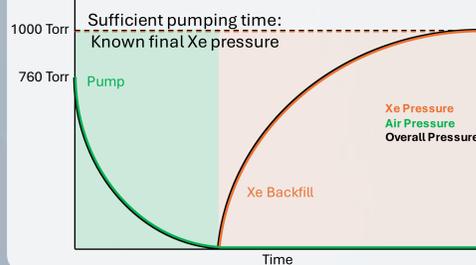

Translating XRF data to Target Fill Rate requires a conversion from XRF counts to pressure

The pumping times below were used to guarantee <1 Torr residual air

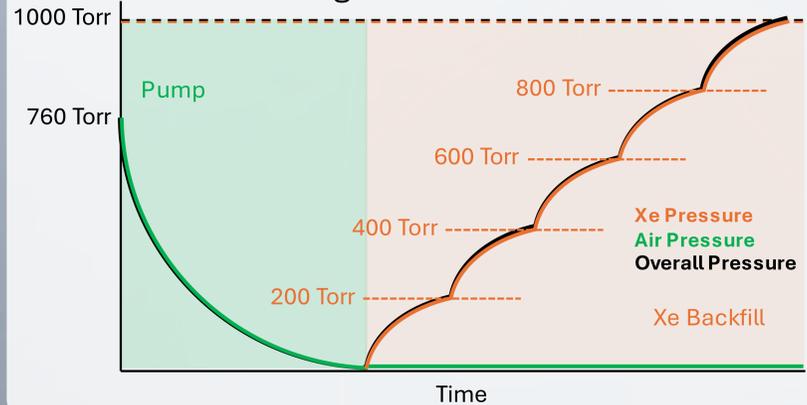

Nominal Fill Tube OD (µm)	Theoretical Pumping Time	Actual Pumping Time
2	7.35 h	88 h [†]
5	20 min	30 min

[†]Pumped over long weekend

XRF/Pressure Calibration by Ramping Pressure

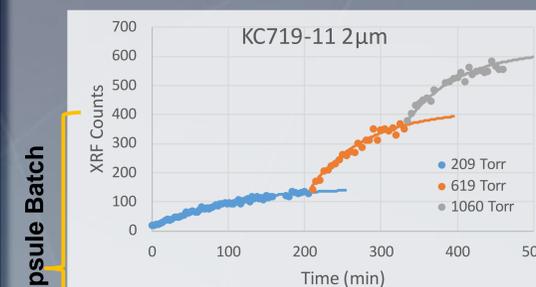

Calibrating XRF Counts to Pressure

Repeat calibration for 2µm and 5µm CFTAs from the same Capsule Batch to verify saturation is not Fill Tube dependent

Repeat for different Capsule Batches to look for statistical variation and other significant factors

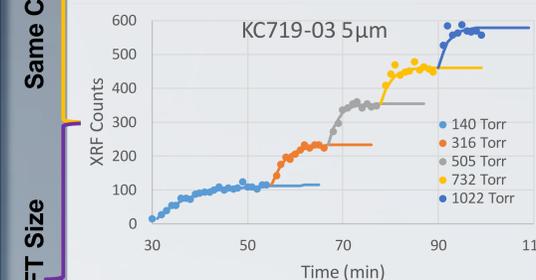

Results are Consistent within Batches and Dependent on Dopant

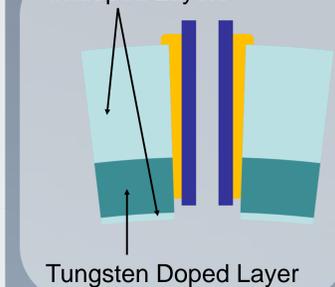

Asymptotic behavior is modeled with an exponential fit

$$C = C_{max} - (C_{max} - C_{offset})e^{-(t-t_0)/t_c}$$

Differences between Capsule Batches observed due to Tungsten Dopant

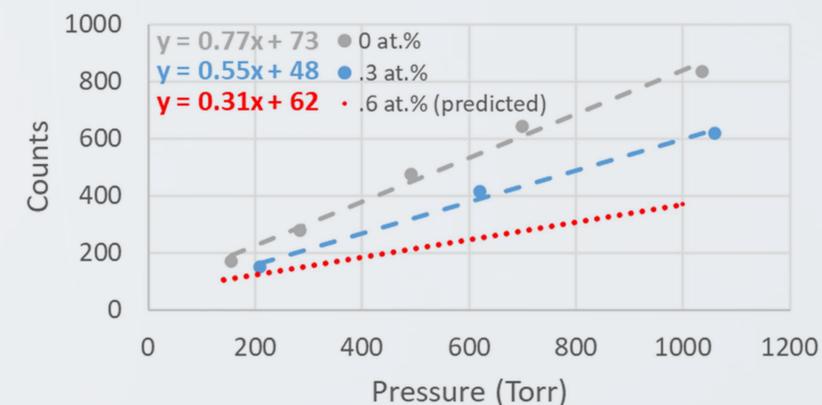

Undoped Layers

Tungsten Dopant is used to keep X-rays out of the fuel

Peak Counts and Pressure are linearly related.

Establishing a Conversion Factor for Dopant Level

Tungsten Dopant is known to block X-rays

Further testing needed with introduction of new Dopants

Future Work: Confirm XRF Fill Rate and Provide to NIF

- Establish dopant multiplier for conversion factor
- Use conversion on existing XRF data to determine Fill Rate
- Compare XRF Fill Rate with NIF Fill Rate from past shots
 - May require additional normalization
- Establish data flow to provide XRF Fill Rate early in Target build process
